Variables, Data Types, Input, Output & Type Casting

1. Create variables to store your name, age, height, and whether you are a student. Print all four variables.

2. Take the user's name and age as input and print a message like: My name is Rahul and I am 20 years old.

3. Take two numbers as input, convert them into integers, and print their sum.

Operators in Python

4. Take two numbers as input and perform addition, subtraction, multiplication, division, floor division, modulus, and exponentiation.

5. Take a number as input and check whether it is greater than 50, less than 100, and equal to 75.

6. Take two numbers as input and use logical operators to check whether both numbers are positive and whether at least one number is even.

7. Create a variable balance = 1000. Use assignment operators to add 500, subtract 200, and multiply the balance by 2. Print the balance after each operation.

Conditional Programming

8. Take a number as input and check whether it is positive, negative, or zero.

9. Take a number as input and check whether it is even or odd.

10. Take a student's marks as input and display Pass if marks are 40 or above; otherwise, display Fail.

11. Take a person's age as input and display whether they are a child (below 13), teenager (13–19), or adult (20 and above).

Loops in Python

12. Take a number as input and print its multiplication table from 1 to 10 using a loop.

13. Use a for loop to print all numbers from 1 to 20.

14. Take a number as input and calculate the sum of all numbers from 1 to that number using a loop.

15. Use a while loop to print numbers from 10 down to 1, and then print Happy Coding!.
